1 Dataset Presentation

The Electoral Atlas of the Second Republic is an ambitious data-compilation and digitization project intended to build a comprehensive database of electoral results of the three general elections that took place during the Second Spanish Republic (1931, 1933, 1936). The Atlas is part of the VEARLYDEM project (*Voting in Early Democracies: The Case of the Spanish Second Republic*), supported by the *Agencia Estatal de Investigación* (PID2023-152743NB-I00 funded by the *Ministerio de Ciencia, Innovación y Universidades*) and developed at the *Universitat Pompeu Fabra de Barcelona*.

The present edition of the database includes electoral results from the first rounds of the 1931, 1933, and 1936 elections and comprises two clearly differentiated parts.[1] On the one hand, it includes several datasets with raw data of electoral results at the individual candidate level for different levels of geographical aggregation (at the electoral precinct, municipality, and district or district levels). This collection of datasets with information at the candidate level allows users to compute their own data aggregations, while also enabling analyses at the candidate level. On the other hand, the database includes a newly constructed and revised dataset of vote shares of political blocs and turnout rates at the municipality and electoral-district level, which relies both on our raw datasets and platform-level electoral data summaries from other secondary sources.[2] By combining all this information, the vote-shares dataset (and specifically its municipal-level variant) constitutes the most comprehensive compilation of detailed electoral results on the Second Republic that has been published to this date, with data for the municipalities and districts of *all* Spanish provinces with available information.

This dataset directly builds on prior data collection efforts. In particular, we use candidate-level electoral data from the *Atlas Electoral de Andalucía* (Cruz Artacho, 2014), the Basque Government's *Archivo de Resultados Electorales* (Gobierno Vasco. Departamento de Seguridad, 2022), and from the work of Prada Rodríguez (2004) on Ourense, Galicia, and of Vall-Prat & Amat (2026) on Catalonia (who in turn build on Vilanova (2005)).[3] Moreover, we rely on data summarized at the party or platform level for Extremadura from Diz Sánchez (2021) and Ayala Vicente (2001); for Albacete from Sepúlveda Losa (2003); for Aragón from Germán Zubero (1982); for Navarra from Villa García (2007); and for Cuenca from López Villaverde (1997). We also rely on data for several provinces (including Alicante, Baleares, Granada, Oviedo, Salamanca, Toledo, Valencia, Zamora and Zaragoza) compiled by Aller Arranz & Iturbe-Ormaetxe (2026) from a combination of primary and secondary sources. Finally, we use district-level data summaries from Álvarez Tardío & Villa

[1] To this date, however, our database only includes data for the three general elections at the district level. At the municipality and lower levels of geographical aggregation, our data only covers the 1933 and 1936 elections. The municipality-level data from the 1931 election will be released in the coming months.

[2] See Section 4.2 Data Sources in the Appendix for a full description of all data sources used.

[3] This work was the result of a data collection effort commissioned by the Generalitat de Catalunya, formalized in the contracts EXI-2022-154 and PR-2023-397.

García (2017), Gómez Salvago (1986), Tusell Gómez et al. (1982), and Villa García (2011) to fill gaps in primary data sources.[4]

Overall, the present database makes two key contributions to data-oriented projects on the Second Spanish Republic. First, it fills geographical gaps in existing datasets of electoral results from the Second Spanish Republic (see, for example, Cruz Artacho (2014), SADEI (1996), or Vilanova (2005), which had a regional focus). It does so by digitizing and making available electoral data from every region of the country that had not been included in prior data-collection efforts. Second, it combines already available data at the precinct and municipality level with newly gathered data to create a comprehensive database of disaggregated electoral results. In doing so, we follow a long history of previous compilation efforts, including already mentioned work with a specific regional focus (Cruz Artacho, 2014; Gobierno Vasco. Departamento de Seguridad, 2022; SADEI, 1996, etc.) and other accounts with a wider geographical focus but more instrumental in nature (that is, applying data to a specific research question), as in Aguilar et al. (2024), Aller Arranz & Iturbe-Ormaetxe (2026), Balcells (2017), and Villamil (2021), among others.

In conclusion, the present dataset aims to overcome the relative fragmentation and the geographical gaps in prior datasets of electoral results from the Second Spanish Republic, offering a completed and comprehensive data compilation that could be particularly useful for future political and economic analyses at low levels of aggregation on the period of the Spanish Second Republic.

[4] In some cases (particularly for the 1931 election) in which data was unreliable or incomplete secondary sources, information was collected from other available sources like Wikipedia and the local press.

2 Dataset Contents

2.1 Note on Dataset Contents

This section provides an overview of the variables included in the database. The list of variables is divided into five groups:

1. The first group refers to geographical information, including the names, municipal-level indicators for capital cities, and official National Statistical Institute (INE) unique identifiers of the different geographical units.
2. The second group of variables comprises different kinds of "raw" electoral information. Variables include the round and date of the election, the identification number or name of geographical units that were meaningful for the administration of the election (district or constituency, census district, and precinct), the number of registered voters and of voters who turned out to vote, the number of votes received by each candidate (in wide format), and the sources of electoral data.
3. The third group of variables comprises information on the candidates running in the election, including their unique identification code, name, party affiliation, electoral platform, political bloc, and votes received (in long format).
4. The fourth group includes "processed" electoral variables computed from raw information and aggregated at the municipality level. These variables range from estimations of the number of registered voters and turnout rates to summary indicators of platform-specific vote means, sums and shares.
5. Lastly, the fifth group comprises miscellaneous variables. These are mainly "diagnostics" indicators about data completeness and levels of aggregation. We also included information that allows users to track the origin of the electoral data used for computations.

Overall, the database is presented in two levels of processing (*raw* and *processed*), three different levels of geographic aggregation (*precinct*, *municipality*, and *district/constituency*), and two different data formats (*wide* and *long*). In total, this gives way to ten different datasets. Six of them include raw information at the individual candidate level, including two precinct-level datasets, two municipality-level datasets, and two district-level datasets, in long and wide formats. We constructed raw municipality-level data by aggregating precinct information and adding additional data only available at the municipality level. On the contrary, district-level data come from official data aggregations, gathered from primary and secondary sources.[5]

The four remaining datasets are data aggregations, including vote shares, turnout rates, and other data summaries at the municipality and district levels, in long

[5]It is important to mention that official district-level aggregations may not completely mirror manual aggregations of municipal-level data into districts. This is due to various motives, like missing data in the municipality-level datasets or (quite often) computation errors in the official district-level vote counts.

and wide formats. These processed data come from raw data aggregated at the political-bloc level as well as platform-level data summaries from other secondary sources.

The following matrices (one for each level of processing) classify the different datasets (with their file name) by level of geographic aggregation and data format.

Table 1: Raw Datasets by Level of Geographic Aggregation and Data Format

Geographic Aggr. / Format	Long Format	Wide Format
Precinct	`dataset_precinct_raw_long.csv`	`dataset_precinct_raw_wide.csv`
Municipality	`dataset_muni_raw_long.csv`	`dataset_muni_raw_wide.csv`
District	`dataset_district_raw_long.csv`	`dataset_district_raw_wide.csv`

Table 2: Processed Datasets by Level of Geographic Aggregation and Data Format

Geographic Aggr. / Format	Long Format	Wide Format
Municipality	`dataset_muni_vote_shares_long.csv`	`dataset_muni_vote_shares_wide.csv`
District	`dataset_district_vote_shares_long.csv`	`dataset_district_vote_shares_wide.csv`

As a result of the variety of aggregation levels (as well as the different formats in which the data is displayed), some variables may be present in some of the datasets but not in others. For example, individual-level variables are only present in "long-format" datasets with raw candidate-level electoral information, whereas processed electoral variables are only available in the municipal and district-level vote shares datasets. Geographic and general "raw" electoral variables are the only variables that are present in all datasets regardless of their content and level of aggregation.[6] The availability of each variable across datasets is specified in the following list of variables under the "Presence in datasets" bullet point within each variable subsection.

2.2 Note on Parties, Platforms, Coalitions, and Political Blocs

Throughout the dataset, we make a distinction between (1) parties, (2) platforms and coalitions, (3) political blocs. **Parties** are identified by the variables `party` and `party_short`, which code the specific party affiliation of candidates. Table 3 shows a list of all parties in the dataset and their presence in the 1931, 1933, and 1936 elections.

But parties seldom filed a single and territorially consistent electoral ticket during the Second Republic. Instead, the majoritarian electoral system, the absence of strong party structures, and the high party fragmentation and proliferation of independent

[6]There are exceptions to this rule. In particular, some geographical variables are not present in aggregate datasets because the geographical units they identify become irrelevant. For example, `mun` and `cod_mun` are not present in district-level datasets.

candidates pushed parties and independent candidates to form district-specific multi-party coalitions or one-party electoral platforms (*candidaturas*), sometimes including independent candidates in the ticket. **Platforms and coalitions** are therefore the specific alliances or electoral tickets formed by parties or independent candidates in each district or constituency in each election. In the dataset, district-specific platforms and coalitions are identified by the variable `platform_full`. Table 5 in the Appendix provides a list of such different platforms and coalitions in each district and election.

Given the high level of electoral complexity in the period, with a large number of district-specific platforms and electoral alliances, we also provide a "summary" of platforms to facilitate electoral and historical analyses. Following previous synthesizing work like that in Villa García (2011) and Álvarez Tardío & Villa García (2017), we group district-specific platforms into **political blocs** with a relatively common ideological profile. This is the main rationale behind the `platform_summ` variable, which sets up a total of 15 election-specific political blocs. In some cases, these blocs correspond to country-wide political alliances (for example, the 1936 *Frente Popular*, or the 1931 *Conjunción Republicano-Socialista*) but in most cases they are aggregations of multiple district-specific ideologically similar coalitions and platforms. See Table 4 for a list of political blocs in each of the elections. Additionally, the list of platforms and coalitions in Table 5 in the Appendix displays the link between platforms and political blocs.

2.3 Notes on Vote Shares and Other Processed Variables

- All variables prefixed with `pct_` or described as percentages (e.g., `turnout_real`, `turnout_est`, etc.) are stored as numeric continuous values and scaled from 0 to 100.
- These processed percentage variables also include additional information in a "computation" subsection that outlines the assumptions, advantages, and limitations of each variable.
- To clarify levels of aggregation in variable computations, different sub-indices are used: i refers to individual candidates, p refers to political groups (whether they are parties, platforms or blocs), j refers to geographical units, and t refers to election dates.
- In constituencies with raw data at the individual candidate level, `platform_summ` variables with individual candidate-level information were used for computing `pct_` municipal-level vote share variables. For municipalities from other constituencies for which data was already aggregated to political platforms in secondary sources,[7] we computed vote share variables by changing the

[7]The only case in which we used aggregate platform-level data despite the fact that individual candidate-level data is available is Catalonia. We relied on aggregate data from the Catalan provinces due to time constraints, but we plan to add individual candidate-level information in the future, merging our raw data with the raw data from Vall-Prat & Amat (2026).

original platform names (such as "*Izquierda*", "*Frente Popular*","*Front d'Esquerres*", or "*Derecha*") to align the naming of platforms with the categories in the `platform_summ` variable.[8]

- Using `platform_summ`, which codes "synthetic" political blocs, as the basis for vote share variables, poses an important methodological challenge: most formulas for computing vote shares are built for calculating the vote shares of platforms and not of larger political blocs, because they are based on assumptions about voters' political behavior *vis-à-vis* the electoral choices they face. For simplicity, we opt for applying platform-optimized formulas to our political blocs, even if these may bundle several platforms together in certain districts. This approach is likely to cause biases in the computed vote shares, but given the complexity of the universe of political groupings, we consider this to be the most effective approach.

2.4 Missing Data Policy

2.4.1 Raw Data

- `elect` (registered voters) and `votant` (actual voters) variables: whenever any of these variables is missing or 0, they are coded as NA.[9]
- Voting data:
  - Whenever all voting data are missing for all candidates in a certain precinct, the precinct is coded as NA.
  - Whenever all voting data are missing for all candidates in a certain municipality, the municipality is removed from the dataset.
  - Otherwise, scattered missing data are coded as 0, assuming the specific candidate received 0 votes.

2.4.2 Processed Data

- For turnout variables (e.g., `turnout_real`, `turnout_est`, etc.), if any component is missing, the variable is coded as NA.
- For vote-share variables:
  - If a platform didn't exist in a district, all corresponding `sum_`, `mean_`, and `pct_` variables for that platform are coded as NA for all municipalities in the district if the data are in wide format, and directly removed if the data are in long format.

[8] Other (usually very small) platforms that were neither left-wing nor right-wing were assigned to the category "other".

[9] Additionally, when aggregating data geographically, we only use `elect` and `votant` data at the precinct level whenever both are present in a precinct, in order to avoid biased turnout computations.

- If voting data for a municipality is generally missing (with no data for any platform), the municipality is removed from the dataset.
- If there is no data for a certain platform in a certain municipality but that platform existed in the municipality's district and there is data for other platforms in the municipality, we code the `sum_`, `mean_`, and `pct_` variables for the missing platform in the municipality as 0.

Note: the decision to completely remove municipalities with no electoral information is intended to achieve consistency in handling missingness. In the raw, original data we extracted, municipalities could be directly not present in the sources, or present but with no data, which we considered as equivalent situations of missing data. We reflected this in the data by removing municipalities with no data in any of the voting variables.

2.5 List of Variables

2.5.1 Geographic Data

2.5.1.1 ccaa

- **Description:** name of post-1978 autonomous community (*comunidad autónoma*).
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** INE.

2.5.1.2 cod_ccaa

- **Description:** INE post-1978 autonomous community (*comunidad autónoma*) identifier code.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.

  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.

- **Data source:** INE.

2.5.1.3 prov

- **Description:** province (*provincia*) name.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** INE.

2.5.1.4 cod_prov

- **Description:** INE province (*provincia*) identifier code.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** INE.

2.5.1.5 island

- **Description:** island name (if applicable).
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** INE.

2.5.1.6 PJ

- **Description:** judiciary district (*partido judicial*) name.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct and municipality level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** Beltrán Tapia et al. (2021), based on INE data.

2.5.1.7 prov_cap

- **Description:** indicator of whether a municipality is the capital city of its province (1) or not (0).
- **Variable/Data type:** categorical binary (stored as numeric 0/1).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct and municipality level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** Beltrán Tapia et al. (2021), based on INE data.

2.5.1.8 PJ_cap

- **Description:** indicator of whether a municipality is the capital city of its judiciary district (1) or not (0).
- **Variable/Data type:** categorical binary (stored as numeric 0/1).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct and municipality level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** Beltrán Tapia et al. (2021), based on INE data.

2.5.1.9 mun

- **Description:** municipality name.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct and municipality level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** voting data sources and INE.

2.5.1.10 cod_mun

- **Description:** INE unique municipality identifier code. This code is composed of:
  - Two first digits identifying the province (these are equivalent to the `cod_prov` provincial code).
  - Three digits identifying the municipality within the province.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct and municipality level.

  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.

- **Data source:** INE.

2.5.2 Raw Election Data

2.5.2.1 elect_round

- **Description:** variable specifying whether the election is a first round (1) or a runoff (2).
- **Variable/Data type:** categorical ordinal (stored as numeric integer).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** not applicable.

2.5.2.2 year

- **Description:** variable specifying the year of the election (1931, 1933, 1936).
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** not applicable.

2.5.2.3 date

- **Description:** Specific election date.
- **Variable/Data type:** date (stored as `Date` object in ISO 8601 format: `YYYY-MM-DD`).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** not applicable.

2.5.2.4 circuns

- **Description:** electoral constituency/district (*circunscripción*) name.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** Tusell Gómez et al. (1982), Villa García (2011), Álvarez Tardío & Villa García (2017).

2.5.2.5 total_seats

- **Description:** variable indicating the total number of parliamentary seats elected in each electoral constituency/district.
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.

- **Data source:** Tusell Gómez et al. (1982), Tusell Gómez (1971), Wikipedia - Anexo: Diputados electos en las Elecciones generales de España de 1936, Wikipedia - Anexo: Diputados electos en las Elecciones generales de España de 1933, and Wikipedia - Anexo: Diputados electos en las elecciones generales de España de 1931.

2.5.2.6 majority_seats

- **Description:** variable indicating the maximum number of candidates that voters could include in their ballot in each electoral district (typically around 80% of the total seats in the district). This number effectively defined the size of a majority platform (*candidatura de mayorías*), i.e., the number of candidates a party or coalition could strategically nominate to maximize electoral efficiency.
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** Tusell Gómez et al. (1982), Tusell Gómez (1971), Wikipedia - Anexo: Diputados electos en las Elecciones generales de España de 1936, Wikipedia - Anexo: Diputados electos en las Elecciones generales de España de 1933, and Wikipedia - Anexo: Diputados electos en las elecciones generales de España de 1931.

2.5.2.7 dist

Note: census districts—a form of municipal sub-division above precincts—should not be confused with electoral districts/constituencies.

- **Description:** census district number within each municipality.
- **Variable/Data type:** categorical ordinal (stored as numeric integer).[10]
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct level.
  - *Data structure*: long and wide.
  - *Processing type:* raw.

[10] Unique districts are identified with the number "0".

- **Data source:** voting data sources. See Section 4.2 Data Sources in the Appendix for a complete description of voting data sources used for each geographical level of aggregation.[11]

2.5.2.8 dist_text

Note: census districts—a form of municipal sub-division above precincts—should not be confused with electoral districts/constituencies.

- **Description:** specific census district name in constituencies where a name was used to identify census districts.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct level.
  - *Data structure*: long and wide.
  - *Processing type:* raw.
- **Data source:** voting data sources. See Section 4.2 Data Sources in the Appendix for a complete description of voting data sources used for each geographical level of aggregation.

2.5.2.9 sec

- **Description:** precinct number within each census district in each municipality.
- **Variable/Data type:** categorical ordinal (stored as character).[12] [13]
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct level.
  - *Data structure*: long and wide.
  - *Processing type:* raw.

[11] We generally included district numbers following those of the original data source. However, in cases in which districts were not identified with a number (especially in big cities like Madrid or Valencia), we opted for including arbitrary district numbers, while keeping the original text-based district name in the `dist_text` variable.

[12] Unique precincts are identified with the number "0".

[13] In some cases, the original sources had duplicate precinct numbers. Thus, we decided to add the original number followed by the "_bis" suffix to identify a precinct that appears for the second time. Hence, this forces us to save the variable as character, not as numeric.

- **Data source:** voting data sources. See Section 4.2 Data Sources in the Appendix for a complete description of voting data sources used for each geographical level of aggregation.

2.5.2.10 sec_text

- **Description:** specific precinct name in constituencies where a name was used to identify precincts.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct level.
  - *Data structure*: long and wide.
  - *Processing type:* raw.
- **Data source:** voting data sources. See Section 4.2 Data Sources in the Appendix for a complete description of voting data sources used for each geographical level of aggregation.

2.5.2.11 elect

- **Description:** number of registered voters (*electores*) in the geographical unit.
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** voting data sources. See Section 4.2 Data Sources in the Appendix for a complete description of data sources used for each geographical level of aggregation.

2.5.2.12 votant

- **Description:** number of voters that turned out in the geographical unit.
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** voting data sources. See Section 4.2 Data Sources in the Appendix for a complete description of data sources used for each geographical level of aggregation.

2.5.2.13 idcand1_[candidate-district-election code]

- **Description:** group of variables (one for each candidate-district-election: idcand_3602330001, idcand_3602330002, idcand_3602330003, etc.) specifying the number of votes received by each candidate in each geographical unit in a given election. Each candidate in each electoral district and election is identified with unique code (e.g.: 3602330003, 3602060001, etc.). This code is different in each $idcand1_i$ variable and is equivalent to the candidate codes in the individual-level `idcand1` variable (see below).
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: wide.
  - *Processing type:* raw.
- **Data source:** see Section 4.2 Data Sources in the Appendix for a complete description of data sources used for each geographical level of aggregation.

2.5.2.14 data_source

- **Description:** summarized source of the data. Values: BOP (*Boletín Oficial de la Provincia*), ACD (*Actas del Archivo del Congreso de los Diputados*), Credentials ACD (*Credenciales de Diputados del Archivo del Congreso de los Diputados*) and PA (Provincial Archives) for data from primary sources; and the specific author, newspaper, or repository for data from secondary sources.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** not applicable.

2.5.3 Individual-Level Data

2.5.3.1 idcand1

Note: Not to be confused with the `idcand1_[candidate-district-election code]` group of variables.

- **Description:** variable that provides a unique identifier code for each candidate with more than 500 total votes in each electoral district and each election. Other candidates, as well as blank and null votes, are included in this variable as two separate residual categories for each election year. This code is equivalent to the different unique candidate identifier codes present in the name of `idcand1_[candidate-district-election code]` variables. Codes are composed of 10 digits (3602330003, 3602060001, etc.):
  - 2 digits identify the election year (e.g., 36).
  - 2 digits identify the election month (e.g., 02).
  - 2 digits identify the district's provincial code (e.g., 28 [Madrid]).
  - 1 digit specifies if the district is provincial or city-based (e.g., 0 [Madrid_provincia], 1 [Madrid_capital]).
  - 3 digits identify each candidate that received more than 500 votes in the district, ordered alphabetically using both surnames.

  Blank and null votes are identified with the residual codes 3602000000, 3311000000, and 3106000000; other candidates (receiving less than 500 votes) are identified with the residual codes 3602000001, 3311000001, and 3106000001.

- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long.
  - *Processing type:* raw.
- **Data source:** own elaboration.

2.5.3.2 full_cand_name

- **Description:** full name of each candidate identified with an `idcand1` code. A full name is usually composed of a first name and two last names that can include several words. Other candidates and blank and null votes are classified in two residual categories, `other` and `blank_and_null`, respectively.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long.
  - *Processing type:* raw.
- **Data source:** names gathered from raw district-level voting data sources. See Section 4.2 Data Sources in the Appendix for a complete description of district-level sources.

2.5.3.3 elected_status

- **Description:** indicator specifying the electoral status of the candidate following the election. Values:
  - elected_first_round = candidate was elected as an MP in the first round.
  - not_elected = candidate was not elected as an MP (neither in the first nor in the second round).
  - invalidated = candidate was elected as an MP in the first round but had elected status invalidated by the parliamentary credentials' committee.
  - replacement = candidate was not elected as an MP in the first round, but due to the invalidation of another candidate's elected status, was proclaimed as elected by the parliamentary credentials' committee.

  - elected_second_round = candidate was elected as an MP in the second round.
  - resigned = candidate resigned as an MP, triggering a second round.

- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long.
  - *Processing type:* raw.
- **Data source:** Álvarez Tardío & Villa García (2017), Villa García (2011), and Tusell Gómez et al. (1982); supplementary details checked in Wikipedia - Anexo: Diputados electos en las Elecciones generales de España de 1936, Wikipedia - Anexo: Diputados electos en las Elecciones generales de España de 1933, and Wikipedia - Anexo: Diputados electos en las elecciones generales de España de 1931.

2.5.3.4 cand_votes_circuns

- **Description:** total number of votes received by each candidate in each electoral district or constituency (`circuns`), as specified in district-level data sources.
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct and municipality level.
  - *Data structure*: long.
  - *Processing type:* raw.
- **Data source:** see Section 4.2 Data Sources in the Appendix for a complete description of district-level sources.

2.5.3.5 party / party_short

- **Description:** party affiliation of each candidate identified with an `idcand1` code. `party` includes full party names, whereas `party_short` only includes party initials. Other candidates and blank and null votes are classified in two residual categories, `other` and `blank_and_null`, respectively. In several cases, sources did not list specific candidates into any of the official platforms running in a certain constituency. We opted for coding those candidates as "*independientes*" (independents).[14] The following table shows a list of the values of the `party_short` and `party` variables followed by a column indicating the year in which each specific party label appears in the dataset.

Table 3

party_short	party	Years
AN	Acción Nacional	1931
ARP	Agrupación Republicana Provincial	1931
ASR	Agrupación al Servicio de la República	1931
Agr(PRR)	Agrarios-Radicales	1931
AlRep	Alianza Republicana	1931
CNT	Confederación Nacional del Trabajo	1931
CR	Concentración Republicana	1931
DLR	Derecha Liberal Republicana	1931
DRR	Democracia Rural Republicana	1931
DRV	Derecha Regional Valenciana	1931
FRG/ORGA	Federación Republicana Gallega / Organización Republicana Gallega Autónoma	1931
IR(PRR)	Izquierda Republicana (Partido Radical)	1931
IRYA	Izquierda Revolucionaria y Antiimperialista	1931
LA	Liga Agraria	1931
LR	Lliga Regionalista	1931
LdC	Liga de Campesinos	1931
PAC/Agr	Partit Agrari de Catalunya	1931
PARG	Partido Agrario Radical Gallego	1931
PCR	Partit Catalanista Republicà	1931
PL	Partido Liberal	1931
PNzR	Partido Nazonalista Republicano	1931
PRA	Partido Republicano Autónomo	1931
PRRSA	Partido Republicano Radical Socialista Autónomo	1931
PRSD	Partido Republicano Social Demócrata	1931
PRSR/PSR	Partido Radical Socialista Revolucionario / Partido Social Revolucionario	1931
PRT(PRR)	Partido Republicano Tinerfeño (Partido Radical)	1931
PSR	Partido Social Revolucionario	1931
RSP	Republicanos al Servicio del Pueblo	1931

[14] The only exception are several of candidates in the 1931 election in León, for whom we are clearly missing party affiliation information. Those candidates are coded as NA.

- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long.
  - *Processing type:* raw.
- **Data source:**
  - 1931: Tusell Gómez et al. (1982), Wikipedia, Vall-Prat & Amat (2026). Specific details for certain provinces double-checked in Gil Cuadrado (2006), Las Merindades en la Memoria (2011), Barrio Gozalo (1988), Company Matas (2015), Gobierno Vasco. Departamento de Seguridad (2022), García Ramos (2001), Gómez Salvago (1986), Cruz Artacho (2014), López López (2014), M. de la C. Marcos del Olmo (2015), Quijada González (2001), Rey Soto (2018), as well as other open internet resources on specific candidate biographies and the local press.

  - 1933: Villa García (2011). Specific details for certain provinces double-checked in Saz Aguilar & Saz Pérez (2006), M. C. Marcos del Olmo (1987), Velasco Gómez (1980), Gómez Salvago (1986), Sierra Cibiriain & Gracia (2012), Las Merindades en la Memoria (2021), García Umbón (1989), Rubio (2019), Molas (1999), Arrabal López (1997), as well as other open internet resources on specific candidate biographies and the local press.
  - 1936: Tusell Gómez (1971), Álvarez Tardío & Villa García (2017). Specific details for certain provinces double-checked in Álvarez Rey & Ruiz Sánchez (1990), Berlinches Balbacid (2016), Caro Cancela (1987), Checa Godoy (2007), Cobo Romero (1997), Gobierno Vasco. Departamento de Seguridad (2022), López Martínez (1992), Martín Nieto (2021), Requena-Gallego (1982), and the local press.

2.5.3.6 platform_full

- **Description:** electoral platform or coalition affiliation of each candidate identified with an `idcand1` code. Other candidates and blank and null votes are classified in two residual categories, `other` and `blank_and_null`, respectively. This variable is broader than the `party` variable. For a full list of platforms in each district and election year, see Table 5 in the Appendix.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long.
  - *Processing type:* raw.
- **Data source:**
  - 1931: Tusell Gómez et al. (1982), Wikipedia, Vall-Prat & Amat (2026). Specific details for certain provinces double-checked in Gil Cuadrado (2006), Las Merindades en la Memoria (2011), Barrio Gozalo (1988), Gobierno Vasco. Departamento de Seguridad (2022), García Ramos (2001), Gómez Salvago (1986), Cruz Artacho (2014), López López (2014), M. de la C. Marcos del Olmo (2015), Quijada González (2001), Rey Soto (2018), as well as other open internet resources on specific candidate biographies and the local press.
  - 1933: Villa García (2011). Specific details for certain provinces double-checked in Saz Aguilar & Saz Pérez (2006), M. C. Marcos del Olmo (1987), Velasco Gómez (1980), Gómez Salvago (1986), Sierra Cibiriain & Gracia (2012), Las Merindades en la Memoria (2021), García Umbón (1989), Rubio (2019), Molas (1999), Arrabal López (1997), as well as other open internet resources on specific candidate biographies and the local press.

– 1936: Tusell Gómez (1971), Álvarez Tardío & Villa García (2017). Specific details for certain provinces double-checked in Álvarez Rey & Ruiz Sánchez (1990), Berlinches Balbacid (2016), Caro Cancela (1987), Checa Godoy (2007), Cobo Romero (1997), Gobierno Vasco. Departamento de Seguridad (2022), López Martínez (1992), Martín Nieto (2021), Requena-Gallego (1982), and the local press.

2.5.3.7 platform_summ

- **Description:** simplified electoral platform or political bloc of each candidate identified with a unique `idcand1` code. Other candidates and blank and null votes are classified into two residual categories, `other` and `blank_and_null`, respectively. This variable is broader than the `party` and `platform_full` variables, and in some cases (especially when there is not a large coalition) it may group different `platform_full` categories together. The following table shows a list of the values of the `platform_summ` variable, including a description of each label and a column indicating the years in which the platform appears in the dataset. Additionally, Table 5 in the Appendix provides a full list of the political platforms and coalitions assigned to each `platform_summ` political bloc label in each district.

Table 4

platform_summ	Description	Years
broad_republican_socialist_-coalition	Coalition of left-wing and center-right republicans and the Socialist Party (PSOE) in the 1931 election.	1931
center_right_republican_platforms	Platforms including centrist and center-right republican parties running independently, as well as alliances of center-left and center-right republican parties, in the 1931 and 1933 elections.	1931,1933
communist_and_other_lw_-platforms	Label grouping the platforms of the Communist Party (PCE) and other small left-wing workers parties in the 1931 and 1933 elections.	1931,1933
left_wing_regionalist_platforms	Platforms led by regionalist or peripheral nationalist left-wing parties in Catalonia, Basque Country, and Galicia in the 1931 and 1933 elections.	1931,1933
left_wing_republican_platforms	Platforms composed of left-wing republican parties or candidates without socialist or center-right republican components in the 1931 and 1933 elections.	1931,1933
left_wing_republican_socialist_-coalition	Alliance of left-wing republicans and the Socialist Party (PSOE) in the 1931 and 1933 elections.	1931,1933
right_wing_platforms	General label for the different right-wing coalitions and independent platforms that ran in the 1931 and 1933 elections.	1931,1933

(*continued*)

platform_summ	Description	Years
right_wing_regionalist_platforms	Platforms led by regionalist or peripheral nationalist right-wing parties in Catalonia, Basque Country, and Navarra in the 1931 and 1933 elections.	1931,1933
socialist_platforms	Platforms in which the Socialist Party (PSOE) ran independently of other republican parties in the 1931 and 1933 elections.	1931,1933
other	Other small political platforms and independent candidates not included in the other labels.	1931,1933,1936
basque_nat_coal	Platforms led by the Basque Nationalist Party (PNV) in the 1936 election.	1936
centrist_platforms	Collection of center-left and center-right republican platforms running independently of the two main coalitions in the 1936 election.	1936
left_coalition	'Popular Front' Coalition of left-wing parties in the 1936 election.	1936
right_coalition	Coalition of right-wing parties in the 1936 election.	1936

- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long.
  - *Processing type:* raw.
- **Data source:** own elaboration, inspired in the categorizations in Villa García (2011) and Álvarez Tardío & Villa García (2017).

2.5.3.8 votes

- **Description:** number of votes received by each candidate identified with a unique `idcand1` code in each geographical unit. This variable displays exactly the same data reported in the idcand1$_i$ list of variables. The latter are only present in wide-format versions of the dataset, whereas `votes` is only present in long-format versions. Votes cast for other candidates (receiving less than 500 votes in the district) and null and blank votes are pooled into the residual categories `other` and `blank_and_null`.
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:** none.

- **Presence in datasets:**
  - *Geographic scale*: precinct, municipality, and district level.
  - *Data structure*: long.
  - *Processing type:* raw.
- **Data source:** See Section 4.2 Data Sources in the Appendix for a complete description of data sources used for each geographical level of aggregation.

2.5.4 Processed Electoral Data

2.5.4.1 elect_est

- **Description:** estimated number of registered voters ("electors") in the municipality.
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:** computed by following 2 steps:
  1. Estimate district and national-level ratios of electors to total population (using 1930 population figures).
  2. Compute estimated number of electors by multiplying municipal population figures and:
     1. The district-specific elector/population ratio if only some municipalities within each district are missing electors' data.
     2. The national elector/population ratio if all municipalities in a district are missing electors' data.
- **Presence in datasets:**
  - *Geographic scale*: municipality and district level.
  - *Data structure*: long and wide.
  - *Processing type:* processed.
- **Data source:** own elaboration based on INE census data and electors data from primary or secondary sources, as specified in Section 4.2 Data Sources in the Appendix.

2.5.4.2 total_votes

- **Description:** total number of votes cast in the geographical unit, including votes to candidates and blank and null votes.[15] [16]
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:**

$$\text{total_votes}_{jt} = \sum \text{cand}_{ijt} + \text{null/blank}_{jt}$$

- **Presence in datasets:**
  - *Geographic scale*: municipality and district level.
  - *Data structure*: long and wide.
  - *Processing type:* processed.
- **Data source:** own elaboration, using raw voting data from primary or secondary sources. For raw voting data sources, see Section 4.2 Data Sources in the Appendix.

2.5.4.3 sum_votes / sum_votes_[platform_summ]

- **Description:** variable (in long format) or group of variables (one for each political bloc from the `platform_summ` variable, in wide format) specifying the sum of the number of votes for every candidate of each political bloc (`platform_summ`) in each geographical unit.
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:**

$$\text{Long format:} \quad \text{sum_votes}_{pjt} = \sum \text{idcand1_[candidate-district code]}_{ipjt}$$

$$\text{Wide format:} \quad \text{sum_votes_[platform_summ]}_{pjt} = \sum \text{idcand1_[candidate-district code]}_{ipjt}$$

- **Presence in datasets:**
  - *Geographic scale*: municipality and district level.
  - *Data structure*: long and wide.

[15] This variable is not equivalent to the `votant` variable, because the electoral system allowed voters to cast more than one vote per person. See the description of the `majority_seats` variable for more details.

[16] The `total_votes` variable follows a slightly different computation method in district-level datasets. Given that these are based on candidate-level voting summaries at the district level, blank and null votes are not included in the sum.

  - *Processing type:* processed.

- **Data source:** own elaboration, using raw voting data from primary or secondary sources. For raw voting data sources, see Section 4.2 Data Sources in the Appendix.

2.5.4.4 mean_votes / mean_votes_[platform_summ]

- **Description:** variable (in long format) or group of variables (one for each political bloc from the `platform_summ` variable, in wide format) specifying the mean number of votes for every candidate of each political bloc (`platform_summ`) in each geographical unit. These averages are computed by dividing the sum of votes for all candidates in each bloc (`sum_votes`) by the effective number of candidates in each bloc. Both the numerator and the denominator can be different across platforms in each geographical unit.
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:**

$$\text{Long format:} \quad \text{mean_votes}_{pjt} = \frac{\text{sum_votes_[platform_summ]}_{pjt}}{\text{Number of Candidates in pjt}}$$

$$\text{Wide format:} \quad \text{mean_votes_[platform_summ]}_{pjt} = \frac{\text{sum_votes_[platform_summ]}_{pjt}}{\text{Number of Candidates in pjt}}$$

- **Presence in datasets:**
  - *Geographic scale*: municipality and district level.
  - *Data structure*: long and wide.
  - *Processing type:* processed.
- **Data source:** own elaboration, using raw voting data from primary or secondary sources. For raw voting data sources, see Section 4.2 Data Sources in the Appendix.

2.5.4.5 turnout_real

- **Description:** electoral turnout in each geographical unit, computed using the number of actual voters (`votant`) and registered voters (`elect`), where available. If data was missing or clearly wrong in any of the two variables (for example, with an unreasonable large number of electors), then this variable was coded as NA.
- **Variable/Data type:** quantitative continuous (stored as numeric).

- **Computation:**

$$\text{turnout_real}_{jt} = \left(\frac{\text{votant}_{jt}}{\text{elect}_{jt}} \right) \times 100$$

  - Assumptions:
    - It assumes that the official electoral census (`elect`) and precinct-level turnout records (`votant`) accurately reflect the true number of registered and actual voters.
  - Advantages:
    - It provides the most direct, official, and theoretically accurate measure of electoral participation.
    - It is independent of voting behaviour (e.g., it is not affected by how many candidates a voter chose).
  - Limitations:
    - It is highly vulnerable to historical data gaps, archival inconsistencies, or census errors (such as outdated or artificially inflated voter registries).
    - Due to missing and inconsistent data that was coded as NA, this variable suffers from a higher rate of missing observations in the municipal-level dataset.

- **Presence in datasets:**
  - *Geographic scale*: municipality and district level.
  - *Data structure*: long and wide.
  - *Processing type:* processed.

- **Data source:** own elaboration, using raw voting data from primary or secondary sources. For raw voting data sources, see Section 4.2 Data Sources in the Appendix.[17]

2.5.4.6 turnout_est

- **Description:** estimated electoral turnout in each geographical unit, computed using the total number of votes cast (`total_votes`), the maximum number of candidates voters could include in their ballot in each electoral district (`majority_seats`), and estimated electors data (`elect_est`).
- **Variable/Data type:** quantitative continuous (stored as numeric).

[17] In certain cases (for example, for Albacete or Baleares) in which information was obtained directly in an aggregate-percentage format from a secondary source, we included the reported turnout figure as `turnout_real`.

- **Computation:**[18]

$$\text{turnout_est}_{jt} = \left(\frac{\text{total_votes}_{jt} / \text{majority_seats}_{jt}}{\text{elect_est}_{jt}} \right) \times 100$$

  - Assumptions:
    - To estimate the number of actual voters (the numerator), it assumes that every single voter used their maximum number of allowed votes (`majority_seats`).
    - It also assumes that the estimated census (`elect_est`) is a reliable demographic proxy for the actual number of registered voters.
  - Advantages:
    - It maximizes data coverage by allowing a turnout calculation even when explicit official records for voters or electors are missing.
    - By relying on estimated voter data computed using candidate vote counts and population census data, it bypasses wrong or inconsistent values in either the `elect` or `votant` variables.
  - Limitations:
    - It mechanically underestimates the actual number of voters (and thus, turnout) if a portion of the electorate did not use all their available votes (e.g., voting for incomplete lists).
    - Because both the numerator and denominator rely on proxies and estimations, the resulting figure can occasionally yield logically impossible values (surpassing 100%).

- **Presence in datasets:**
  - *Geographic scale*: municipality level.[19]
  - *Data structure*: long and wide.
  - *Processing type:* processed.

- **Data source:** own elaboration using INE population data and raw voting data from primary or secondary sources. For raw voting data sources, see Section 4.2 Data Sources in the Appendix.

[18] This variable strongly correlates with the `turnout_real` variable (0.75 corr.). However, since it's a turnout estimation, individual values may not completely match those of the `turnout_real` variable, and in some cases they may surpass the theoretical maximum of 100%.

[19] We do not include this variable in the district-level dataset because there are no missing data in the `turnout_real` variable.

2.5.4.7 pct_votes_sumbased / pct_votes_sumbased_[platform_summ]

- **Description:** variable (in long format) or group of variables (one for each political bloc as defined in the `platform_summ` variable, in wide format) specifying the vote share of each political bloc (`platform_summ`) in each geographical unit. It uses vote sums in the numerator and the total number of votes cast in each geographical unit in the denominator to calculate vote shares.
- **Variable/Data type:** quantitative continuous (stored as numeric).
- **Computation:**

$$\text{Long format:} \quad \text{pct_votes_sumbased}_{pjt} = \left(\frac{\text{sum_votes}_{pjt}}{\text{total_votes}_{jt}} \right) \times 100$$

$$\text{Wide format:} \quad \text{pct_votes_sumbased_[platform_summ]}_{pjt} = \left(\frac{\text{sum_votes_[platform_summ]}_{pjt}}{\text{total_votes}_{jt}} \right) \times 100$$

- Assumptions:
  - It conceptualizes electoral support as the number of votes received by a platform, using the "volume of votes" received as a measure of support from voters.
  - It assumes that every voter used all his/her electoral votes available, not necessarily following party discipline.
- Advantages:
  - Mathematically straightforward.
  - It relies solely on candidate vote counts, bypassing the need for other data which may be missing or inconsistent (like the reported number of voters). As a result, these vote-shares variables have a broader geographical coverage compared to pct_votes_meanbased_[platform] variables.
  - The sum of all vote shares in a geographical unit equals or approximates 100%.
  - When applied to political blocs and not to official electoral platforms or tickets in a certain district, results are closer to capturing real political support than other measures. In particular, it correctly captures the intuition that if a bloc combines two platforms together, their vote shares should add up, at least approximately. In this formula, vote shares increase when a bloc includes a larger number of candidates—for example, by combinining different full platforms together—as more candidates means more votes are added to the numerator while the denominator remains constant. On the contrary, vote shares remain lower for blocs with less candidates for the same reason—for example, when blocs bundle together a lower number of platforms, or when they include incomplete or smaller platforms or independent candidates.

- Limitations:
  - It fails to account for voters that did not use all their available electoral votes (e.g., when supporting a platform fielding a small number of candidates). Consequently, it mechanically inflates the electoral support of political groups with more candidates, under-representing smaller groups. Although this "mechanical inflation effect" is an advantage in bloc-level vote-share summaries for the reasons described above (in short, that a combination of platforms should lead to a larger combined vote share), it may raise some concerns about the real support of smaller platforms as well.
- **Presence in datasets:**
  - *Geographic scale*: municipality and district level.
  - *Data structure*: long and wide.
  - *Processing type:* processed.
- **Data source:** own elaboration, using raw voting data from primary or secondary sources. For raw voting data sources, see Section 4.2 Data Sources in the Appendix. Computation strategy based on the analysis of electoral results by Vilanova (2005).

2.5.4.8 pct_votes_meanbased / pct_votes_meanbased_[platform_summ]

- **Description:** variable (in long format) or group of variables (one for each political bloc as defined in the `platform_summ` variable, in wide format) specifying the vote share of each political bloc (`platform_summ`) in each geographical unit. It uses the mean number of votes in each geographical unit in the numerator and the number of voters in each geographical unit in the denominator to calculate vote shares.[20]
- **Variable/Data type:** quantitative continuous (stored as numeric).[21]
- **Computation:**

$$\text{Long format:} \quad \text{pct_votes_meanbased}_{pjt} = \left(\frac{\text{mean_votes}_{pjt}}{\text{votant}_{jt}} \right) \times 100$$

[20] The coding of these variables is more restrictive than that of `pct_votes_sumbased_[platform]` variables, because it relies on the actual number of voters. Thus, these variables take NA values in geographical units where an official number of voters is missing.

[21] A number of municipalities showed inconsistent vote shares significantly exceeding 100%. This seemed to stem from incomplete turnout records at the precinct level. Consequently, we followed two complementary strategies: 1) we coded municipalities with complete candidate vote counts but incomplete voter records as NA; 2) we applied a 150% threshold as the inclusion criterion (i.e., municipalities with platform-specific vote shares larger than 150% were coded as NA).

$$\text{Wide format:} \quad \text{pct_votes_meanbased_[platform_summ]}_{pjt} = \left(\frac{\text{mean_votes_[platform_summ]}_{pjt}}{\text{votant}_{jt}} \right) \times 100$$

- Assumptions:
  - It conceptualizes electoral support as "number of voters" who included a platform in their ballot.
  - It equates mean votes received by all candidates in the platform with the number of voters supporting the platform.
  - It assumes high party discipline, with voters supporting a single platform regardless of the number of candidates fielded.
- Advantages:
  - It is a more realistic estimation of a platform's "electoral base" (percentage of voters supporting a platform).
  - It does not inflate the vote shares of platforms fielding more candidates.
- Limitations:
  - It is mathematically more complex and has more missing data and a higher potential for errors, since it relies on two types of data: candidate vote counts and number of voters.
  - It does not account for the possibility of "panachage" (i.e., voters splitting their votes across different platforms). Consequently, the sum of vote shares in a geographical unit can easily surpass 100%.
  - By relying on the mean vote to all candidates in a platform as a proxy for the number of voters supporting a platform, it is vulnerable to the presence of exceptionally popular or unpopular candidates that may significantly skew a platform's average electoral support.
  - When applied to political blocs and not to official electoral platforms or tickets in a certain district, results from this vote share formula are strongly biased. Since political support is normalized by the number of candidates in a bloc, the formula heavily under-represents blocs with a larger number of candidates—for example, those combining platforms together, as well as those including platforms with a large number of candidates.
- **Presence in datasets:**
  - *Geographic scale*: municipality and district level.
  - *Data structure*: long and wide.
  - *Processing type:* processed.
- **Data source:** own elaboration, using raw voting data from primary or secondary sources. For raw voting data sources, see Section 4.2 Data Sources in

the Appendix. Computation strategy based on the analysis of electoral results by Álvarez Tardío & Villa García (2017).

2.5.4.9 pct_votes_original / pct_votes_original_[platform_summ]

- **Description:** variable (in long format) or group of variables (one for each political bloc as defined in the `platform_summ` variable, in wide format) specifying the vote share of each political bloc (`platform_summ`) in each geographical unit as reported in secondary sources (where available).[22]
- **Variable/Data type:** quantitative continuous (stored as numeric).
- **Computation:** none.
  - Assumptions:
    - The main assumption is that all vote shares computed by secondary sources are comparable.
  - Advantages:
    - No additional computation needed.
  - Limitations:
    - We have no control/information over the formula used by secondary sources for computing vote shares.
- **Presence in datasets:**
  - *Geographic scale*: municipality and district level.
  - *Data structure*: long and wide.
  - *Processing type:* processed.
- **Data source:** Sepúlveda Losa (2003) for Albacete, Germán Zubero (1982) for Aragón, Diz Sánchez (2021) for Cáceres, "El Tea" (3/07/1936) for Pontevedra.

2.5.4.10 pct_votes_combined / pct_votes_combined_[platform_summ]

- **Description:** variable (in long format) or group of variables (one for each political bloc as defined in the `platform_summ` variable, in wide format) specifying the vote share of each political bloc (`platform_summ`) in each geographical unit. Where available, these variables take the value of the `pct_votes_sumbased` variables. Otherwise, they take the values of the `pct_votes_original` variables.
- **Variable/Data type:** quantitative continuous (stored as numeric).

[22] This variable takes NA values in all provinces with disaggregated data.

- **Computation:** none.
  - Assumptions:
    - The main assumption is that `pct_votes_sumbased` variables and `pct_votes_original` variables are comparable.
  - Advantages:
    - Allows maximization of data coverage to all available constituencies.
  - Limitations:
    - We have no control/information over the formula used by secondary sources for computing vote shares in `pct_votes_original`, which may limit comparability with `pct_votes_sumbased` variables.
- **Presence in datasets:**
  - *Geographic scale*: municipality level.[23]
  - *Data structure*: long and wide.
  - *Processing type:* processed.
- **Data source:** same sources as `pct_votes_sumbased` and `pct_votes_original` variables.

2.5.4.11 first_platform

- **Description:** variable indicating the electoral platform that received the plurality of votes in the geographical unit.
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: municipality and district level.
  - *Data structure*: long and wide.
  - *Processing type:* processed.
- **Data source:** own elaboration based on `pct_votes_sumbased` and `pct_votes_original`.

[23]This variable does not exist in district-level datasets, as we have "sumbased" data for all districts.

2.5.4.12 elected_candidates / elected_candidates_[platform_summ]

- **Description:** variable (in long format) or group of variables (one for each political bloc as defined in the `platform_summ` variable, in wide format) indicating the number of candidates elected for each political bloc (`platform_summ`) in each district.
- **Variable/Data type:** quantitative discrete (stored as numeric).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: district level.
  - *Data structure*: long and wide.
  - *Processing type:* processed.
- **Data source:** Tusell Gómez et al. (1982), Villa García (2011), Álvarez Tardío & Villa García (2017), Tusell Gómez (1971).

2.5.5 Other Variables

2.5.5.1 aggregation_level

- **Description:** indicator in the master dataset that specifies the minimum level of aggregation available for each data entry (precinct, municipality, island).
- **Variable/Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: master dataset only.
  - *Data structure*: long.
  - *Processing type:* raw.
- **Data source:** own elaboration.

2.5.5.2 sec_missing_votes

- **Description:** indicator that specifies if a precinct lacks all voting data (1) or not (0).
- **Variable/Data type:** categorical binary (stored as numeric 0/1).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: precinct level.
  - *Data structure*: long and wide.
  - *Processing type:* raw.
- **Data source:** own elaboration.

2.5.5.3 total_sections

- **Description:** municipality_level indicator that specifies the number of precincts within each municipality.
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:** count of the number of precincts in each municipality.
- **Presence in datasets:**
  - *Geographic scale*: municipality level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** own elaboration.

2.5.5.4 missing_sections

- **Description:** municipality_level indicator specifying the number of precincts with no data within each municipality.
- **Variable/Data type:** quantitative discrete (stored as numeric integer).
- **Computation:** count of the number of precincts with no data in each municipality.
- **Presence in datasets:**
  - *Geographic scale*: municipality level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.

- **Data source:** own elaboration.

2.5.5.5 completeness_pct

- **Description:** municipality_level indicator specifying the percentage of electoral precincts with missing data within each municipality.
- **Variable/Data type:** quantitative continuous (stored as numeric).
- **Computation:**

$$\text{completeness_pct}_j = \left(\frac{\text{missing_sections}_j}{\text{total_sections}_j} \right) \times 100$$

- **Presence in datasets:**
  - *Geographic scale*: municipality level.
  - *Data structure*: long and wide.
  - *Processing type:* raw and processed.
- **Data source:** own elaboration.

2.5.5.6 raw_data_origin

- **Description:** indicator in the municipality vote-shares datasets specifying if the data come from aggregated micro-data present in the "raw" datasets or if they come from aggregate data gathered from secondary sources. Values: micro_data, aggregate_data.
- **Data type:** categorical (stored as character).
- **Computation:** none.
- **Presence in datasets:**
  - *Geographic scale*: municipality level.
  - *Data structure*: long and wide.
  - *Processing type:* processed.
- **Data source:** own elaboration.
